

LABORIS pays particular attention to research and development of innovative protective coatings in terms of formulation and technology.

LABORIS can realize the optimization of new protective systems based on the specific needs of customers, providing the characterization of the products analyzed in the process of improving the coating and the final evaluation report of the product identified.

LABORIS task is the formulation of water-based paints, solvent-free paints and solvent based paints. All formulation studies are aimed at finding environmentally friendly solutions, by searching the most suitable components to replace those with environmental issues, present or future, usually used in paints and varnishes and a careful search for new solutions that respect the environment by identifying and dictating new "constructive" and productive technologies of various components of the coating.

Our water-based paint systems are characterized as required by standard [ISO 12944](#) . We are able to offer paint systems for corrosive classes C3, C4, C5 and C5-M-I.

We can provide water-based paint systems and even personalized to meet your needs.
